Section 1 : Coding

1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

Input Format

The first line consists of an integer n , representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string *k*, representing the contact to be checked or removed.

Output Format

If the given contact exists in the dictionary:

1. The first line prints "The given key is removed!" after removing it.
2. The next *n* - 1 lines print the updated contact list in the format: "Key: *X*; Value: *Y*" where *X* represents the contact's name and *Y* represents the phone number.

If the given contact does not exist in the dictionary:

1. The first line prints "The given key is not found!".
2. The next *n* lines print the original contact list in the format: "Key: *X*; Value: *Y*" where *X* represents the contact's name and *Y* represents the phone number.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: 3

Alice 1234567890

Bob 9876543210

Charlie 4567890123

Bob

Output: The given key is removed!

Key: Alice; Value: 1234567890

Key: Charlie; Value: 4567890123

Answer

```
// You are using GCC
```

```
#include<iostream>
```

```
#include<unordered_map>
```

```
#include<vector>
```

```
using namespace std;
```

```
int main(){
```

```

int n;
cin>>n;
unordered_map<string,string>contactMap;
vector<string>insertionOrder;
string name,number;
for(int i=0;i<n;++i){
    cin>>name>>number;
    contactMap[name]=number;
    insertionOrder.push_back(name);
}
string keyToCheck;
cin>>keyToCheck;
if(contactMap.find(keyToCheck)!=contactMap.end()){
    cout<<"The given key is removed!"<<endl;
    contactMap.erase(keyToCheck);
    for(string&key:insertionOrder)
    {
        if(key!=keyToCheck){
            cout<<"Key: "<<key<<";Value: "<<contactMap[key]<<endl;
        }
    }
}
else{
    cout<<"The given key is not found!"<<endl;
    for(string&key:insertionOrder)
    {
        cout<<"Key: "<<key<<";Value: "<<contactMap[key]<<endl;
    }
}
return 0;
}

```

Status : Correct
